Major: Bachelor of Science in Computer Science- Software Systems | **Minor:** Business Administration
The University of Tennessee at Chattanooga   **Graduation date:** May 2018

About Me

- https://github.com/ayseboogie
- I enjoy taking on new challenges and continuously growing my skill set. I thrive in an environment that promotes clear communication and encouraging each other to be our best.
- I am motivated, innovative, and passionate about frontend development.
- To note: I have recently picked up my passion for freelance development again, and made an ecommerce site for my friends at my local market. This project has been fun, and is continuously improving as I navigate the world of Wordpress. - https://chifarms.org/

Experience

Lonely Planet – Red Ventures   **October 2019 – Current**

Software Engineer

- Working in multiple repositories and CMSs¸ including routing in dispatch, chasing down build fails in Jenkins, creating and editing pages in Drupal, testing with Mocha in WebdriverIO, adding / editing features in amp articles, and most commonly coding React in a Next.js framework.
- Collaborates with coworkers proactively, taking ownership of tickets and seeing them through until completion.
- Working closely with the SEO team since the acquisition in December. Pair programming with other developers to learn, teach, and bounce ideas.
- Consistently reviewing PRs to critique, approve, and learn new methods / about new repositories.
- Contributing ideas, implementing solutions, squashing bugs, consolidating our stack, and continuously learning and growing as an engineer are a few of my favorite things I have gotten to do in this job.

Legendary Supply Chain   **November 2018 – September 2019**

Software Engineer

- Build custom functionally smooth pages on the Salesforce platform that are geared toward making our clients' supply chain process as simple as possible.
- Use Apex as the Server Side Controller, calling dynamic SOQL queries. On the front end, both Visualforce pages and components, and Lightning Components are required. Lightning components are comprised of

HTML, CSS, a JavaScript controller, and a JavaScript helper to act as an intermediary between Server Side and Client Side.

- Work with objects consisting of pick lists, dependent picklists, lookups, master detail relationships, formulas, and more.
- Responsible for creating Validation Rules, FieldSets, Triggers, and Process Builder functions.
- Adding components to the page layout via standard and custom methods, then uploading them to production.
